## THE CLAIMS

- (previously presented) A biped toy that can walk on two feet, comprising: 1. 1
- symmetrically disposed leg portions and arm portions moved by a driving means in the 2
- interior of a torso, 3
- wherein said driving means is a motor or a power spring, 4
- wherein foot portions to be rotated in a rolling direction of a main body of the toy are 5
- coupled to said leg portions, and said leg portions to be driven in forward, rearward, up and 6
- down directions of said toy main body are disposed within the lower of said torso, 7
- wherein first link members of said leg portions are driven by making circular motion 8
- while maintaining a mounting angle against said torso in the interior of said leg portions and said 9
- torso, and second link mechanisms of said foot portions comprise a link member which is driven 10
- by moving up-and-down, 11
- wherein a shift of weight of said toy main body is taken by positioning a center of gravity 12
- of said toy main body on a first leg portion, 13
- wherein a step forward by a second leg portion is taken, 14
- wherein said foot portions with the shift of weight of said toy main body is driven toward 15
- the rolling direction, and 16
- whereby repeating a cycle of movement which shifts the center of gravity between said 17
- first and second leg portions, said toy main body can continuously walk. 18
- (previously presented) A biped toy that can walk on two feet as set forth in claim 1, 2. 1
- wherein the first link member is supported by a rotatable cam and two assistant cams 2
- which are rotatable with and following the driving of the first member by said rotatable cam, and 3

4	whereby a trace of movement of the first link member in profile of said main body car

- 5 make circular movement with remaining a mounting angle against said toy main body.
- 1 3. (new) A biped toy that can walk on two feet, comprising:

From-Swidler Berlin Shereff Friedman

- 2 symmetrically disposed leg portions moved by a motor disposed in the interior of a torso,
- wherein foot portions to be tilted in the left and right directions of said biped toy are
- 4 attached to said leg portions, and said leg portions to be moved in forward, rearward, up-and-
- 5 down directions of said biped toy are disposed therein,
- 6 wherein cams are disposed in an output shaft of said motor, and the assistant cams are
- 7 rotatably mounted by rotation of said cams,
- wherein a first link member of one of said leg portions is driven by a rotation of said
- 9 assistant cams against said torso in the interior of said leg portions, and a second link member is
- driven by a rotation of said cams in the up-and-down directions, and a third link member
- attached to said foot portions is driven in the up-and-down directions by moving of said second
- 12 link member.
- wherein said foot portions with a shift of weight of said biped toy is driven toward a
- 14 rolling direction, and
- wherein repeating a cycle of movement which shifts the center of gravity between left
- and right of said leg portions, said biped toy can continuously walk.
- 1 4. (new) A biped toy that can walk on two feet as set forth in claim 3, wherein
- 2 symmetrically disposed arm portions moved by said motor, and said are portions are attached to
- 3 one of said assistant cams through outside of said biped toy, and wherein said are portions are
- 4 driven by rotation of said assistant cams.

P.008

## Attorney Ref. 18920.0040

(new) A biped toy that can walk on two feet as set forth in claim 3, wherein

From-Swidler Berlin Shereff Friedman

- symmetrically disposed arm portions moved by said motor, and said are portions are attached to 2
- one of said assistant cams through outside of said biped toy, and wherein said are portions are 3
- driven by rotation of said assistant cams.
